

# **Image Classification In** **Tomato leaf Disease** **Detection Using** **Convolutional Neural** **Network**

**Deep Learning !**

# **#. Introduction!**

- **To increase the agricultural productivity , enhance the performance of pesticides.**
- **To ensuring the health and productivity of plants and maintain the growth.**
- **Facilitate of timely intervention , essential to prevent or mitigate negative outcomes.**

# #. Motivation!

- **Timely pesticides for plants disease was provided by expert people in village , and its take time to give timely treatment.**
- **Now a days it become tedious to give fast and timely treatments for village formers.**
- **To provide the timely and fast treatment .**
- **we have designed the model which will detect disease in less time and provide satisfactory solution .**

# #. Task !

- **Trained a custom CNN from scratch , obtained a better performance on our CNN MODEL.**
- **Used various pre-trained model for tomato leaf dataset , to find out the best accuracy model for our dataset.**

# #. General Architecture:

# #. Image Datasets !

**Tomato Late Blight**

**Tomato Early Blight**

**Tomato Septoria**

**Tomato Leaf Mold**

**Tomato Septoria**

Target Spot**

**Tomato Spider Mites Two  
Spotted Spider Mite**

**Tomato Yellow Leaf  
Curl Virus**

**Tomato Mosaic Virus**

**Tomato Healthy**

# Data Description:

1. **Precision** = It is defined as what proportion of predicted positive is truly positives.

**#Formula= True Positive/Total**

2. **Recall** = It is defined as what proportion of actual positives is correctly classified .

**#Formula =True Positive/Actual Yes**

3. **F1 Score** = It is define as the average of Precision and Recall value.

**#Formula =  $2 * ( \text{Precision} * \text{Recall} ) / ( \text{Precision} + \text{Recall} )$**

----------------	------------	------------	-----------	------------	------------	------------	------------	-----------	-----------	-----------	-----------

# Why Pre-trained model:

- **Time and Resource efficiency ,needs weeks & months to build a CNN form scratch , required less effort to train the parameter for future used.**
- **Data availability ,Deep learning is data hungry need a huge amount of data to train CNN network.**
- **We have leverage to used its pre-existing knowledge to perform well on a new, similar task, even with limited data also.**

# Pre-trained Network Used !

- **VGG-16**
- **ResNet50**
- **Mobile Net**
- **EfficientNetB0**
- **EfficientNetB1**

# Generalized Cluster Attached After Pre-trained Models...

**Optimizer=Adam**

**Loss Function=Categorical Cross Entropy**

**Epochs=50**

# #. Formula of Categorical Cross Function !

$$\text{Loss} = - \sum_{i=1}^{\text{output size}} y_i \cdot \log \hat{y}_i$$

i	Sample Size
Yi	Actual / Target Value
Yi CAP	Predicted Value

# #. Adom's Formula !

$$m_t = \beta_1 m_{t-1} + (1 - \beta_1) g_t$$
$$v_t = \beta_2 v_{t-1} + (1 - \beta_2) g_t^2$$

$$w_t = w_{t-1} - \eta \frac{\hat{m}_t}{\sqrt{\hat{v}_t + \epsilon}}$$

Both are come from  
Momentum and Adagrad  
concept.

Weight  
Updation  
formula !

# 1. VGG-16 (Visual Geometry Group )

# #. Result:

Model	Top-1 Accuracy	Top-5 Accuracy	Correct Prediction	Total Prediction	In (%) Correct P.
VGG-16	73.3%	90.1%	841	1000	84.1
ResNet50	74.9%	92.1%	972	1000	97.2
Mobile Net	70.4%	89.5%	799	1000	79.9
Efficient NetB0	77.7%	93.3%	899	1000	89.9
Efficient NetB1	80.1%	94.9%	899	1000	89.9

# #. Custom Network :

Created Models	Conv Layers	Max Pool layers	Global Average Pooling Layer	Dense (Output layer)	Accuracy in (%)	Loss in (%)
First Model	3	3	1	1	88	33
Second Model	2	2	1	1	79	63
Third Model	4	4	1	1	83	59

# #. Custom Network Summary :

Created Models	Total Param	Trainable Param	Non-Trainable Param	Correct Prediction	Total Prediction	In (%) correct prediction
First Model	10,490	10,490	0	904	1000	90.4
Second Model	5,690	5,690	0	792	1000	79.2
Third Model	29,306	29,306	0	821	1000	82.1

# #. Result !

- Custom network ,first model get better performance over the other two model.
- Our model classifying correctly at the highest probability which is belong to correct class but it is not exactly equal to truth value of that particular class.
- Loss is 33% ,reason is the gap between truth value and actual value of that particular class , After summation of whole sample ,it got maximize.

# Experimental Setup:

- Platform – Kaggle
- Dataset - Plant Village
- GPU Version-NVIDIA GPU T4\*2
- Batch Size – 32
- Optimizer – Adam
- Loss Function – Categorical Cross Entropy.
- Epoch- 50
- Train/Validation/Test – 70/20/10 (Ratio%)

# #. Conclusion !

- **Trained custom CNN from scratch with an accuracy of 87% ,we have got after evaluation.**
- **Pre-trained model,EfficienNetB0 give the optimal accuracy with an 99% on our datasets.**

# #.Models Interpretation!

Thank you,  
thank you,  
thank you!
